

Security incident report

Section 1: Identify the network protocol involved in the incident

The network protocols involved in the incident are DNS and HTTP . The customer browser sends a DNS request to a DNS server. The DNS server replies with the IP address, The browser initiates an HTTP request. The handshake.

Section 2: Document the incident

A former employee of yummyrecipesforme was able to compromise the website of the company that sells recipes and cookbooks, he used an attack known as brute force to gain access to the web host .

He correctly guessed the password of the administrative account and changed the website's source code. He installed a malware that redirected the customers of the company to a fake website when they accessed the company site . Customers discovered that their system ran slow after downloading a file and informed the company by email.

The company reported the incident the provider hosting the website. To troubleshoot the incident the cybersecurity team ran a network analyzer tool "tcpdump" which reveals a script that redirects the visitors' browsers from yummyrecipesforme.com to greatrecipesforme.com.

Section 3: Recommend one remediation for brute force attacks

One remedy for brute force attacks i would recommend for the company is requiring more frequent password changes. This would prevent former employees to guess correctly the default password of the administration account.
