

# Cybersecurity Incident Report:

## Network Traffic Analysis

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.

The UDP protocol reveals that: The network analyzer tool reveals an outgoing request from my computer to a DNS server via the UDP protocol requesting the IP address of yummyrecipesforme.com.

This is based on the results of the network analysis, which show that the ICMP echo reply returned the error message: "udp port 53 unreachable."

The port noted in the error message is used for: Port 53 is a port for DNS service

The most likely issue is: no service was listening on the receiving DNS port.

Part 2: Explain your analysis of the data and provide at least one cause of the incident.

Time incident occurred: The incident occurred at 1:24 p.m., 32.192571 seconds.

Explain how the IT team became aware of the incident: Several customers of clients reported that they were not able to access the client company website [www.yummyrecipesforme.com](http://www.yummyrecipesforme.com), and saw the error "destination port unreachable" after waiting for the page to load.

Explain the actions taken by the IT department to investigate the incident: They attempted to visit the website and also received the error "destination port unreachable." To troubleshoot the issue, the network analyzer tool, tcpdump, was loaded.

Note key findings of the IT department's investigation (i.e., details related to the port affected, DNS server, etc.): The plus sign after the query identification number indicates there are flags associated with the UDP message. The "A?" indicates a flag associated with the DNS request for an A record. The analyzer shows that when you send UDP packets to the DNS server, you receive ICMP packets

containing the error message: "udp port 53 unreachable."

Note a likely cause of the incident: **No service was listening on the receiving DNS port 53.**
